Sprint 5

Team 1

13 July 2026

Timeline

14th JUNE

+ Present the previous week work for Week 4

+ Assigned roles to each members for new phase

15th June - 21 June 2026

- Automated Data Ingestion & PR Provisioning (Friday 23:00 SGT)
- Independent Agent Analysis & Code Refactoring (Saturday - All Day)
- Pipeline Integration, LLM Consensus & Delta Calibration
- Strategic Human Refinement & Hard Tag Cutoff (Sunday 23:59 SGT)

22th June

+ Presentation about team works and what team have accomplished

Sprint 5 (vW25) Product Owner & Value Increment Update

A comprehensive Agile delivery summary covering the core product increment, scope triage decisions, and the sealed W25 release — demonstrating disciplined execution against a **Level 3 Automated Pipeline** standard.

🚀 INCREMENT

Core Product Increment & Definition of Done

The system's core workflow has officially evolved into a **Level 3 Automated Pipeline**, driven entirely by GitHub Actions for end-to-end, zero-manual-intervention execution. This represents a foundational maturity milestone for the platform.

- **Evidence Agent:** Successfully merged. Market data and charts are now automatically provisioned via GitHub Bot Pull Requests, eliminating manual data-staging steps entirely.
- **Delta Engine:** Automated QA is live and validated. The engine evaluated vW24 with **3/3 directional accuracy** and a mere 0.20% average range error — exceeding quality thresholds.
- **Tech Debt Eradicated:** Completed global path cleanup and executed LLM normalization scripts to standardize timeline architecture across W22–W25, closing long-standing structural drift.

🚧 TRIAGE

Agile Scope Triage & Backlog Decisions

To ruthlessly protect the **Level 3 pipeline**'s delivery commitment and main branch stability, the PO and Dev Lead executed a formal **Triage Decision** — a deliberate, strategic deferral of out-of-timebox work rather than a failure of scope.

- **Backend REST API & Database:** API structure fully mapped and documented, but persistence logic exceeded the Sprint timebox. Formally deferred to the **Sprint 6 Backlog** with full context preserved for handoff.
- **Frontend Blueprinting:** Initial mockups reviewed and accepted at concept level. UI integration formally deferred to subsequent high-priority User Stories with dependency on the REST API layer.

Strategic deferrals are a PO leadership tool — protecting value delivery over breadth of scope.

🔒 RELEASE

Sealed W25 Predictions & Evidence Checklist

The Sprint closes with a fully auditable evidence trail and a hard-locked **Release Tag** pushed to the production repository. All CI smoke tests passed, confirming the increment meets the Definition of Done at the pipeline level.

- **Evidence Checklist Fulfilled:** 3 independent Agent outputs committed, 3 mandatory LLM matrices validated, Human Score logic verified, and Delta Engine logs securely committed before the hard deadline.
- **Hard Lock Confirmed:** Definitive vW25 **Release Tag** securely pushed to the production repository — immutable, auditable, and passing all CI smoke tests without exception.

Sprint 5 closes with a clean, fully traceable release artifact and zero outstanding Definition of Done gaps.

3/3

Directional Accuracy

Delta Engine validated vW24 with perfect directional accuracy on automated QA evaluation.

0.20%

Avg. Range Error

Extremely low average range error recorded by the Delta Engine across all evaluated predictions.

L3

Pipeline Maturity

Core workflow achieved **Level 3 Automated Pipeline** status — the Sprint's primary value commitment.

S6

Deferred Items

Backend REST API and Frontend integration formally moved to the **Sprint 6 Backlog** via PO triage.

Sprint 6 Retrospective

TEAM REVIEW | SPRINT 6

✅ What Went Well

- Sprint kickoff and team roles
- Progress across frontend, backend, and pipelines
- Collaboration and Documentation

⚠️ Challenges

- OpenRouter rate limits blocked the LLM pipeline
- Chat updates were inconsistent
- Integration testing felt rushed

💡 What We Learned

- Always plan API fallback options
- Fault-tolerant pipelines reduce risk
- Early communication surfaces blockers faster

🎯 Next Sprint Actions

- Post progress updates more consistently
- Finish earlier to leave testing buffer
- Strengthen fallback and integration checks

JULY 6–10, 2026 | MIDTERM ELECTION YEAR

R3 - Almanac Agent

Q2–Q3 Weak Spot. Bias: **Mixed** · Confidence: **Medium**

Index Signals

S&P 500
Historically strong; discount in midterm year

Nasdaq
Historically strong, especially first-to-second-half turn

Russell 2000
Can lag if rates stay high

Sector Biases

🟢 XLK — Bullish
Long window (Mar–Jul)

🔴 XLF — Bearish
Short window (May–Jul)

🔴 Gold/Silver — Bearish
Short (mid-May–Jun)

🔴 XLB/XLE — Bearish
Short (May–Oct / early Jun)

Thesis: Cautiously bullish for Nasdaq/tech; mixed for small caps. **Invalidation:** Major macro surprise or technical breakout against bias.

WEEK OF JULY 10 · SOURCE: R4

R4 - Macro Agent

Macro Bias: Binary-risk | **Primary Driver:** US Fed Rate Decision, June 18 | **Confidence:** Medium

3.50–3.75% Fed Rate	**97.4%** Hold Probability
4.560% 10Y Yield	**100.96** DXY
71.56 WTI Crude	**4108.5** Gold

Rates & Yields

2Y: 4.210% · 10Y: 4.560% · 30Y: 5.060% — curve **normal**, 10Y **rising**. Fed hold 97.4% / cut 2.6% — shifted **hawkish**.

Commodities & Dollar

WTI: **+4.18%** rising · Gold: **-0.10%** falling · DXY: **+0.10%** rising

Week-Ahead Calendar

Thu Jun 18 (High): Fed Rate Decision · FOMC Projections · Press Conference

Thu Jun 18 (Med): BoE Rate Decision — Exp: 3.75%

Earnings

Wed Jun 17: Progressive (PGR) · Jabil (JBL)

Thu Jun 18: Accenture (ACN)

Key News

- US stocks rise as oil eases; SpaceX debuts on Wall Street — *AP, Jun 13*
- US & Iran agree to deal wording to end war — *AP, Jun 13*
- Iran peace deal looms; military action flares near Strait of Hormuz — *Reuters/AP, Jun 13*

Invalidation: A materially more dovish-than-expected Fed decision or press conference driving Treasury yields lower would reverse the cautious stance and support risk assets.

TECHNICAL AGENT OUTPUT · WEEK OF 10 JULY 2026

R5 - Technical Agent

Three major indices in Zone 1 Bullish, with SPX and NDX leading and IWM lagging in a neutral-bullish zone.

7,571
SPX
Zone 1 · Bullish

29,819
NDX
Zone 1 · Bullish

295.89
IWM
Zone 2 · Neutral-Bullish

Index	Last Close	8 EMA Gap	21 EMA Gap	Confidence	Key Watch Levels
SPX	7,571	Above 8 EMA	Above 21 EMA	Bullish / Medium	7,578 res · 7,257 sup
NDX	29,819	Above 8 EMA	Above 21 EMA	Bullish / Medium	30,643 res · 28,548 sup
IWM	295.89	Between 8 & 21 EMA	Above 21 EMA	Neutral / Low	302.72 res · 283.40 sup

Primary watch levels: SPX — 7,578 resistance / 7,257 support · NDX — 30,643 resistance / 28,548 support · IWM — 302.72 resistance / 283.40 support. IWM invalidation: below 283.40 bearish; above 302.72 bullish.

Chart Analysis

SPX, NDX, and IWM remain in medium-term uptrends above their 20-day moving averages. The charts highlight key support and resistance levels that traders should monitor for the coming week.

S&P 500 (SPX)

Support: 7,463

Resistance: 7,600

Current: 7,575.39 ((+0.42%)

Nasdaq 100 (NDX)

Support: 29,600

Resistance: 30,100

Current: 29825.11 (+0.33%)

Russell 2000 (IWM)

Support: 293.00

Resistance: 300.00

Current: 295.59 (-0.42%)

SPX and NDX remain above their 20-day moving averages, showing continued bullish momentum despite recent consolidation. IWM is trading slightly below recent highs, suggesting weaker short-term momentum compared to the large-cap indices. Holding above key support levels will be important for maintaining the current market trend.

R6 Data Agent: W25 Empirical Actuals (Ground Truth)

Week 25 market actuals confirm a bifurcated risk-on session: tech and small caps led aggressively while energy collapsed and macro fear gauges settled. Only 5 of 11 sectors finished green, underscoring narrow breadth beneath the headline index gains.

PRIMARY INDICES — RISK-ON

Broader Market: Green Across the Board

The broader market closed higher, led aggressively by tech-heavy and small-cap exposures. Dispersion between NDX and SPX was meaningful at 167 bps — a strong signal of factor rotation into growth.

+2.60%

NDX

Nasdaq 100 — Outperformer. Tech beta amplified gains.

+1.14%

IWM

Russell 2000 — Small caps participated, confirming broad risk appetite.

+0.93%

SPX

S&P 500 — Laggard. Energy drag suppressed the cap-weighted index.

SECTOR EXTREMES — MARKET BREADTH

Massive Divergence: 5 of 11 Sectors Green

Sector-level dispersion reached extreme levels this session. The 1,016 bps spread between XLK and XLE is a textbook risk-on/commodity-off regime signal. Narrow breadth warns that headline index strength is not broadly supported.

🟢 XLK — Technology

+3.59%

Top sector. Drove Nasdaq outperformance. Semis and mega-cap software led intra-sector gains. Momentum factor rewarded.

🔴 XLE — Energy

−6.57%

Worst sector by a wide margin. WTI crude collapse transmitted directly into upstream/midstream equity losses. Significant SPX drag.

MACRO ANOMALIES — CROSS-ASSET SIGNALS

Fear Eased in Equities; Commodity Markets Faced Violent Repricing

Cross-asset macro signals printed a mixed but notable picture. Equity vol compressed sharply as the VIX settled well below its 20-level threshold — a structural calm signal for risk-positioning. Simultaneously, WTI crude suffered a near-10% single-session collapse, one of the most severe commodity drawdowns in recent memory, with direct implications for energy equity positioning, inflation expectations, and petro-state sovereign credit spreads. TLT's modest rally alongside flat 10-year yields suggests duration buyers are not panicking — bonds acted as a mild safe-haven bid rather than a flight-to-quality surge.

VIX — Fear Gauge

−5.09%

Settled at **16.78**. Sub-17 VIX confirms equity market calm and reduced tail-risk hedging demand. Favorable for delta-long positioning and short vol strategies entering W26.

WTI Crude Oil

−9.83%

Closed at **$76.54/barrel**. Violent single-session repricing. Triggers stop-loss cascades in energy longs, compresses energy sector EPS estimates, and reduces breakeven inflation forwards.

TLT — Long Duration Bonds

+1.14%

Rose alongside **flat 10-year yields**. Duration bid was modest — not a crisis signal. Confirms a risk-on-with-moderate-defensiveness posture; cross-asset regime remains constructive for equities.

R6 Agent Ground Truth Summary — W25: Risk-on impulse was real but narrow. Tech (XLK +3.59%) and NDX (+2.60%) dominated while energy (XLE −6.57%) and crude (WTI −9.83%) repriced violently. VIX compression to 16.78 confirms reduced near-term equity tail risk. Bond markets signal no systemic stress. Breadth at 5/11 sectors green warrants caution on broad-market extrapolation.

R7 Human Score: Breaking the AI Deadlock

All 4 LLMs returned an **"Uncertain/Neutral" deadlock**. Human analysis breaks the tie — applying override reasoning across five key dimensions to resolve the conflict and establish a directional market bias.

Dimension	AI View	Team Score	Human Override Reasoning
1. Macro	Binary-risk	**0**	Yields and Oil falling are bullish signals, but DXY rising and a cautious Fed provide offsetting bearish pressure. Net assessment: balanced.
2. Technicals	Bullish	**+1**	SPX, NDX, and IWM all trading firmly above their 8 & 21 EMA on the daily chart. High-confidence uptrend structure intact across major indices.
3. Almanac	Bearish	**−1**	June midterm seasonal weakness pattern remains active. Market currently resides inside the historically weak Q2–Q3 seasonal window. Headwind confirmed.
4. AI Agreement	Uncertain	**+1**	4 out of 4 models independently converged on the exact same narrative and internal conflict. Rare consensus under uncertainty signals a high-quality signal boundary.
5. Wild Card	Missed	**+1**	Extreme leadership concentration in Technology (XLK) was systematically overlooked by all models — a critical AI blindspot with meaningful directional implications.

+2

Human Score Total

Net bias: **Bullish**. Human override resolves the 4-model deadlock with a decisive directional lean.

4/4

LLM Consensus

All four models aligned on the same market narrative conflict — unusual convergence that itself carries signal value.

5

Dimensions Scored

Macro, Technicals, Seasonality, AI Agreement, and Wild Card — each evaluated independently for override eligibility.

Wild Card, Final Call & Hard Invalidation

With the Human Score resolved at **+2 Bullish**, the final prediction framework integrates the AI blindspot discovery, establishes a consensus regime call, and defines the precise technical levels at which the thesis is immediately invalidated.

🃏 WILD CARD: AI BLINDSPOT

Tech Concentration Risk

None of the four models emphasized that **market gains are dangerously concentrated in Technology (XLK)**. This is not a minor omission — it is the single most important structural reality driving current price action.

XLK is in a seasonal LONG window, effectively carrying the broader market on its back while Financials, Energy, and Materials lag or struggle to sustain momentum. The broader index's resilience against June's seasonal drag is almost entirely attributable to Tech's outperformance.

The critical implication: As long as Tech holds its leadership position, the market can continue to absorb seasonal headwinds. But this creates a single point of failure — if XLK cracks, the seasonal weakness currently being masked will be rapidly exposed across the full market structure.

⚠ Tech concentration is the thesis's load-bearing wall. Monitor XLK leadership daily.

🎯 FINAL CONSENSUS PREDICTION

Neutral-Bullish Regime

Regime

Neutral-Bullish — directional lean confirmed by human override score, tempered by structural seasonal drag.

Confidence

Medium — capped by active June midterm seasonality headwinds and single-sector dependency.

NDX Target Range

+0.5% to +3.0% expected outperformance. Nasdaq leads as the primary long expression of this thesis.

🛑 HARD INVALIDATION TRIGGERS

Thesis Is Instantly Wrong If:

SPX Key Support Breach

SPX daily close below **7,238**. This level represents the structural floor underpinning the current uptrend. A confirmed close below invalidates the bullish regime call immediately.

NDX EMA Structure Loss

NDX closes below **28,197** and loses its 8 EMA structure on the daily chart. This signals momentum failure and removes the primary vehicle for the bullish expression.

Tech Leadership Collapse

XLK relative strength breaks down, exposing the broader market to the full force of June seasonality with no offsetting sector to absorb the drag. This is the highest-risk scenario.

R8 Multi-LLM Synthesis: Consensus & Divergence

Four independent large language models — OpenAI (gpt-oss), Nemotron 3 Super, Gemma 4 31B, and Poolside Laguna — were independently queried on current market conditions. The result: unanimous agreement on the **narrative**, violent disagreement on the **math**. What follows is a rigorous synthesis of where the models converge and where they diverge — and what that gap means for risk positioning this week.

OVERALL REGIME: UNCERTAIN / NEUTRAL

CONFIDENCE: MEDIUM — ALL 4 MODELS

🤝 The Qualitative Consensus — The "Tug-of-War"

Every model independently surfaced the same three structural forces pulling the market in opposite directions. No model was able to establish a clean directional bias — precisely because each force is real, measurable, and approximately equal in magnitude. The regime is defined by friction, not trend.

📈 Bullish Technicals

SPX, NDX, and IWM are all trading firmly above their **EMA 8 and EMA 21** on the daily timeframe. Price structure is intact, momentum indicators remain elevated, and breadth has not deteriorated meaningfully. The tape is not broken — it is being held in place by an external ceiling.

📉 Bearish Seasonality

June is **historically the weakest month of the midterm cycle**. Seasonal headwinds are not a soft signal — they represent decades of aggregate institutional behavior around fiscal mid-year rebalancing, tax-loss harvesting, and reduced risk appetite from pension allocators. All four models flagged this as a meaningful drag.

⚖️ Binary Macro Risk

The **June 18 Fed Decision** looms as a binary macro event. Fed Funds futures currently price a **97.4% probability of a hold**, but the real uncertainty lies in the tone and forward guidance. A materially hawkish or dovish surprise could instantly reprice vol across all asset classes, capping broader risk appetite ahead of the announcement.

ⓘ All four models converged on this exact three-force framework independently — no prompting overlap. The consistency of the narrative diagnosis across architecturally distinct models significantly elevates signal confidence, even as quantitative outputs diverge sharply.

📊 The Quantitative Divergence — The Matrix

While the models agree on the story, they **violently disagree on the math.** The table below captures projected weekly price ranges for SPX, NDX, and IWM across all four models. The divergence is not noise — it is a structural signal about how each model weights the Fed binary event relative to technical momentum.

Dimension	OpenAI (gpt-oss)	Nemotron 3 Super	Gemma 4 31B	Poolside Laguna	Consensus Range
SPX Range	**+0.5% to +1.5%**	-3.5% to +1.6%	-1.2% to +1.5%	-3.5% to +1.6%	-3.5% / +1.6%
NDX Range	**+1.5% to +3.5%**	-7.3% to +1.2%	-0.5% to +2.0%	-7.2% to +1.2%	-7.3% / +3.5%
IWM Range	**+0.5% to +1.5%**	-6.5% to +0.8%	-1.0% to +1.2%	-6.4% to +0.8%	-6.5% / +1.5%

🔵 OpenAI: The Isolated Optimist

OpenAI is the sole outlier in the matrix — projecting **pure upside across all three indices** with no downside scenario modeled. Its projections prioritize the technical momentum signal (EMA structure, breadth) and treat the Fed decision as a non-event given the 97.4% hold probability. This is a structurally bullish posture with no tail-risk hedging. It is either the most conviction-driven output — or the most underweighted on macro risk.

🔴 The Other Three: Aggressive Downside Hedging

Nemotron, Gemma, and Poolside Laguna all price in **substantial left-tail risk** — particularly on NDX (up to -7.3%) and IWM (up to -6.5%). The common denominator: all three weight the Fed binary event as a regime-changing variable that cannot be dismissed. The downside range is not a soft hedge — it represents a genuine stress scenario where a hawkish tone collapses multiple expansion in growth assets and triggers a risk-off rotation out of small caps.

⚠️ The **NDX downside range of -7.3%** (Nemotron & Poolside) is the single most extreme output in the matrix and deserves independent scrutiny. This figure implies a full regime break, not a routine pullback. It should be treated as a low-probability / high-severity tail scenario rather than a base case — but it cannot be dismissed given the Fed's outsized influence on growth equity valuations.

🎯 Invalidation & Strategic Takeaway

The synthesis concludes with two high-conviction outputs that **all four models agreed on unanimously** — despite their quantitative divergence. These are the actionable signals extracted from the noise: the one scenario that flips the entire regime, and the one asset class that outperforms regardless of which direction the market resolves.

⚡ The Universal Invalidation Trigger

All four models — including the three bearish-hedged ones — agree on a single, precise invalidation condition for the bearish seasonality thesis:

A **materially dovish-than-expected Fed decision** that drives Treasury yields meaningfully lower will instantly invalidate June's seasonal headwinds and **flip the market regime to Bullish**. This is not a gradual shift — it is a binary catalyst. If the Fed surprises with a cut signal, a rate path downgrade, or a notably softened tone on inflation persistence, the yield compression that follows would immediately reprice risk assets upward, overwhelm the seasonal drag, and restore momentum as the dominant regime driver. The 97.4% hold probability makes this scenario low-probability — but not negligible, and the **asymmetric upside** makes it the most important risk to monitor in real time on June 18.

ⓘ Monitor the 2-year Treasury yield in real time during the FOMC statement. A -5bps or greater move is the threshold signal.

✅ The Safest Structural Bet: NDX Outperformance

Despite the full spectrum of uncertainty — bullish technicals, bearish seasonality, and a binary Fed catalyst — **all four models agree on one thing: Technology (XLK / NDX) will outperform** relative to SPX and IWM regardless of direction.

The rationale is structural, not speculative. NDX remains in a confirmed **seasonal LONG window** for Technology, a pattern that has historically persisted even during broader index weakness. The sector's balance sheet quality, earnings momentum, and AI-driven capital allocation tailwinds provide a structural floor that small caps (IWM) and broader large caps (SPX) do not enjoy to the same degree.

In a risk-off scenario, NDX draws down less than IWM. In a risk-on scenario driven by a dovish Fed, NDX leads the rally. The **Nasdaq is the highest-conviction relative value trade** for the week — not as a directional bet, but as a **regime-agnostic positioning choice.**

Bullish Scenario

NDX leads the rally. Fed dovish surprise + seasonal flip = multiple expansion in growth.

Bearish Scenario

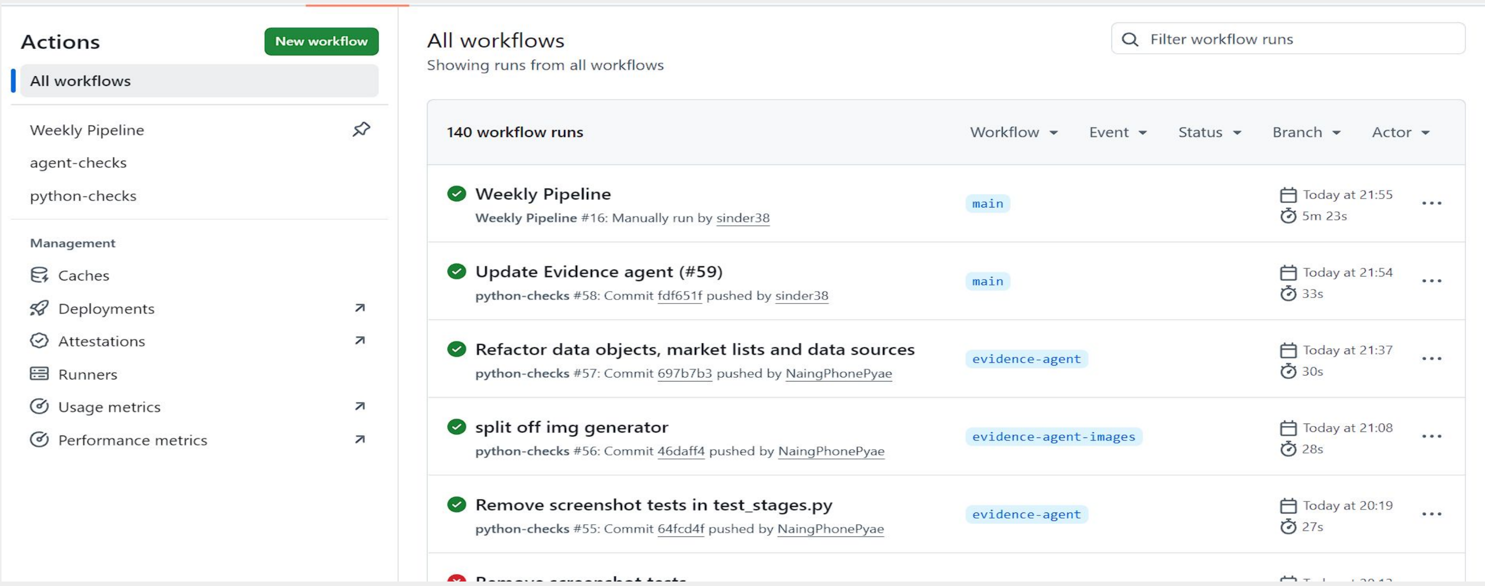
NDX draws down less than IWM. Quality tech acts as a relative safe harbor in risk-off.

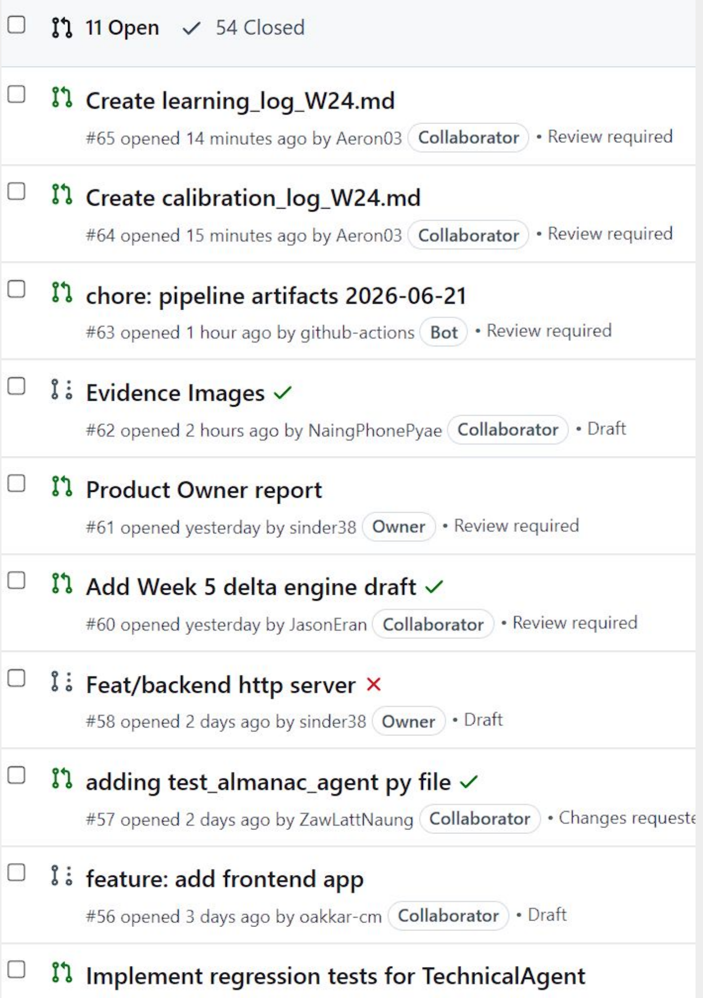
Base Case

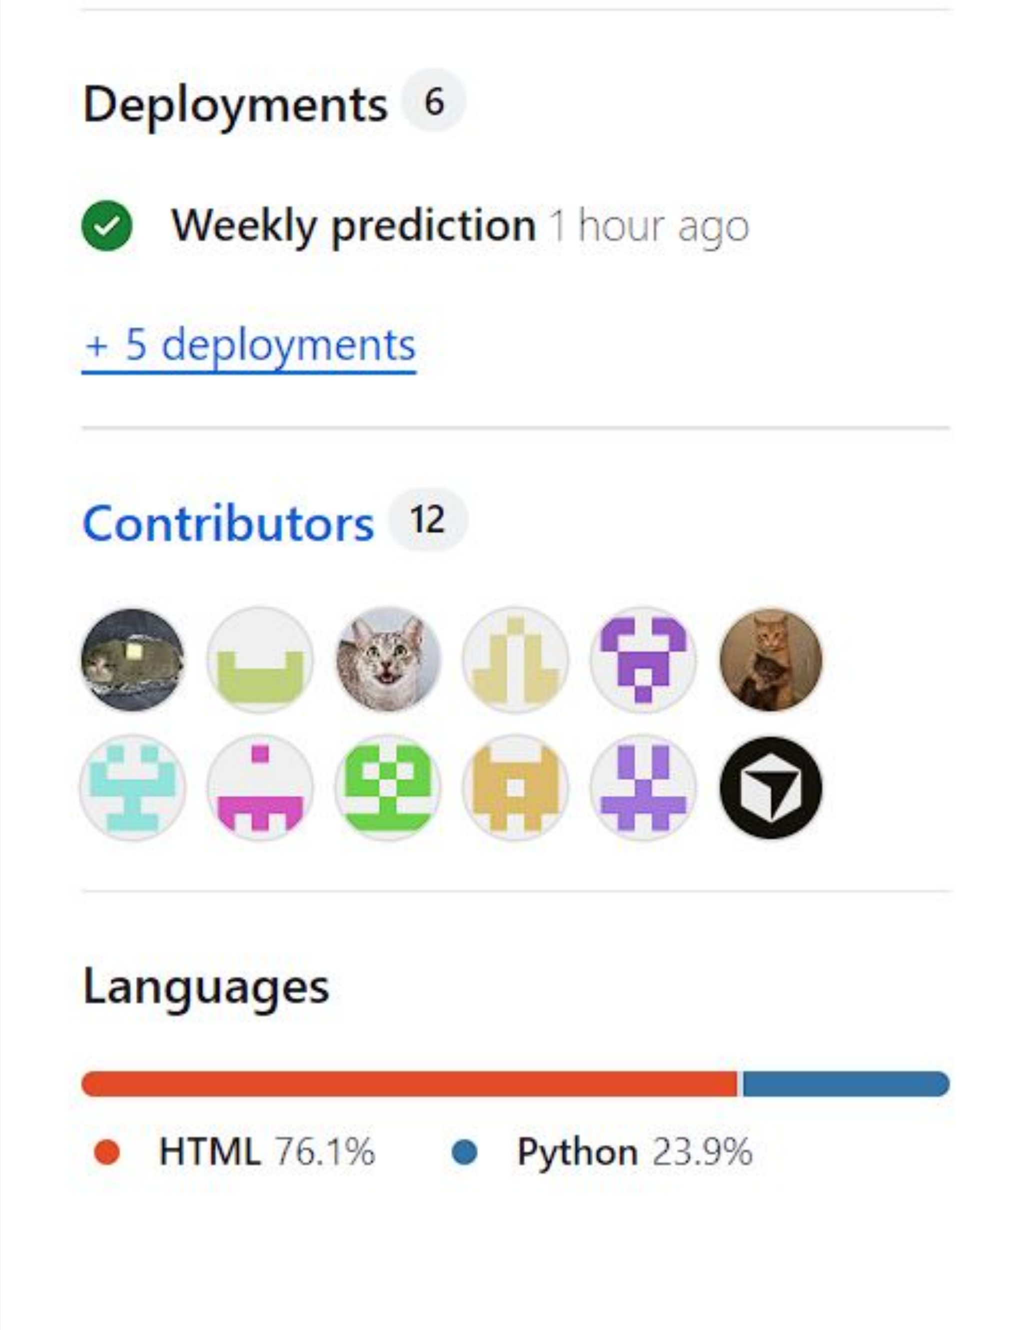
Choppy / neutral regime. NDX holds EMA support while IWM underperforms on Fed uncertainty.

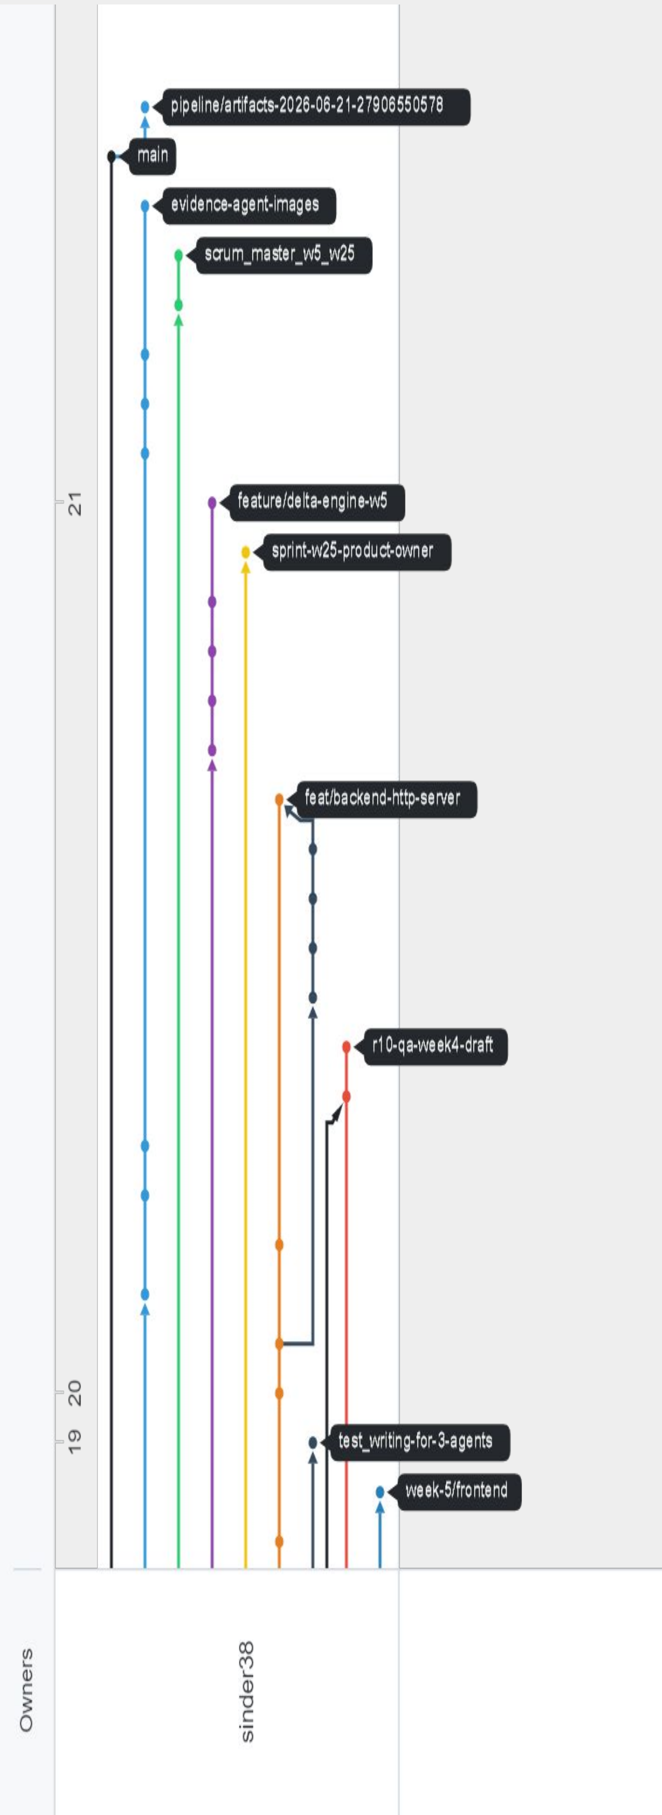
GitHub Repository

- **System Integration:** Successfully connected all isolated Agents into a unified web server pipeline.
- **High Automation Achieved:** High level of automation achieved, eliminating manual friction for data provisioning. PRs merged and reviewed systematically.
- **New job** for enforcing code correctness
- **4** LLM models
- **Tech Debt Eradication:** Conducted comprehensive code quality reviews and removed critical technical debt to stabilize the pipeline.



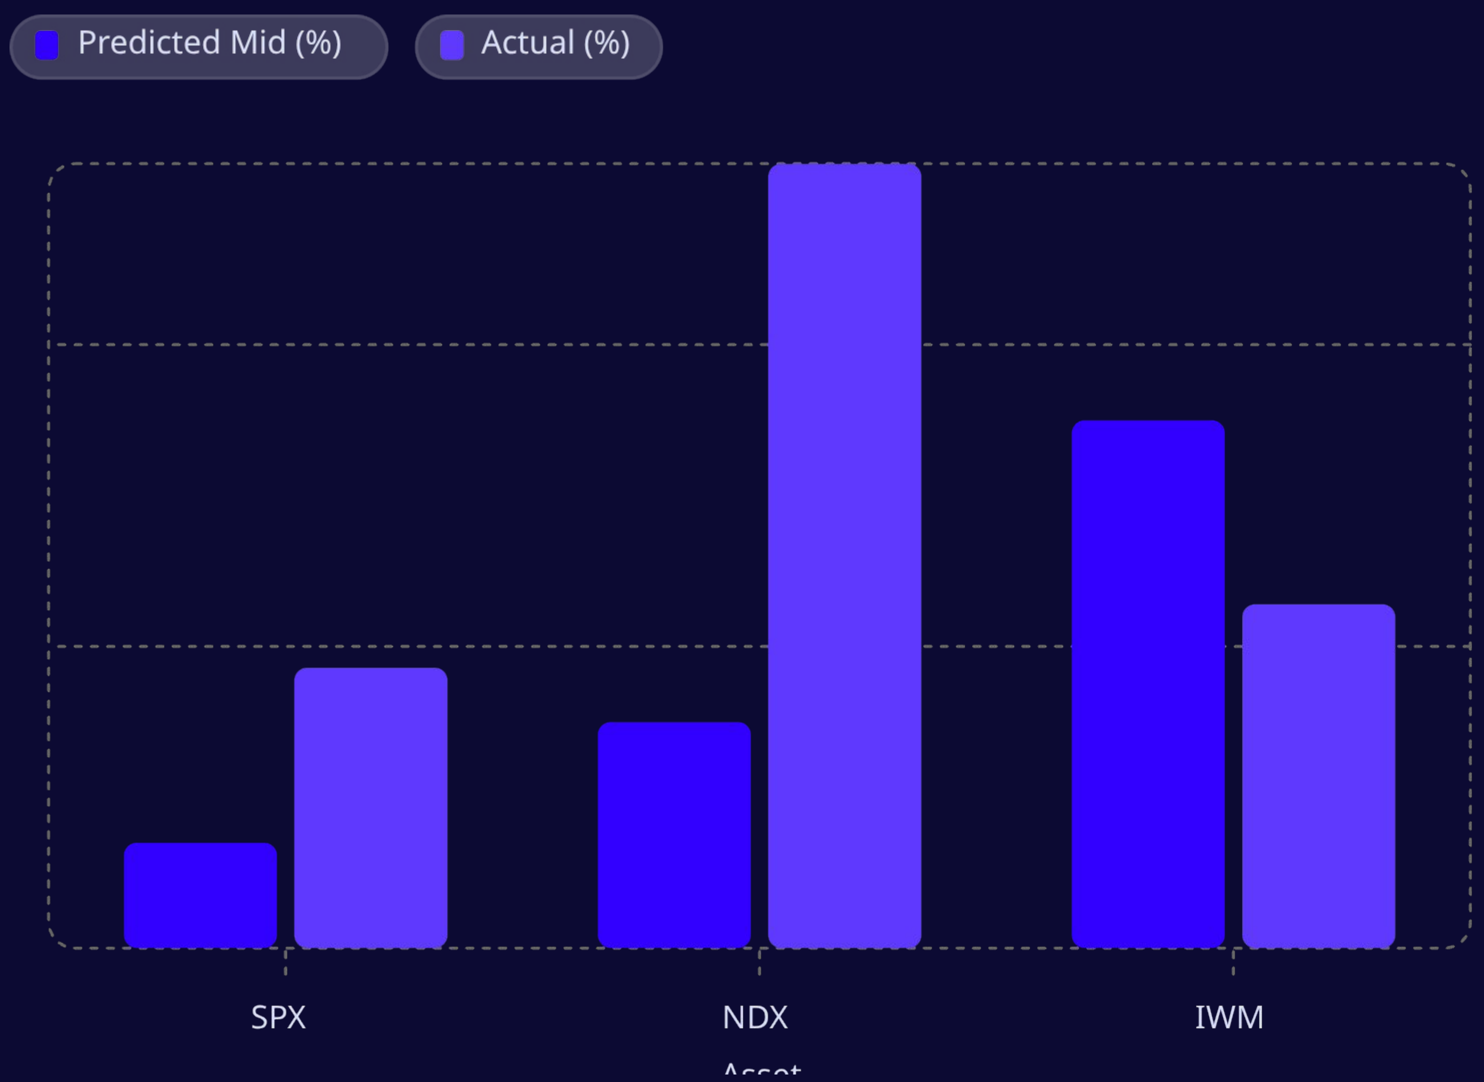






WEEK 24 · CHECKED 21 JUNE 2026

Calibration & Learning Log — Week 24



Score: +7 / +9

Direction: 3/3 · Range: 2/3. NDX overshot by 0.60 pp; chip rally extended. Leadership flipped from IWM to NDX. FOMC posed no binary shock.

Key Lesson

Wild card trends must widen matching index ranges. Team avoided overcorrection after W23 miss.

Next Sprint

Check ranges cover flagged momentum trends; verify leadership order matches sector callouts.

LLM HORSE RACE · WEEK 24

Model Comparison & Horse Race

Model	Regime	Direction	Range Hit	Mid Error
Nemotron	Bullish	Yes	Yes	0.02 pp
gpt-oss-120b	Bullish	Yes	Yes	0.48 pp
Gemma	Neutral	Partial	Yes	0.68 pp
Laguna	Uncertain	Partial	Yes	0.04 pp

Week 24 Winner: Nemotron

Clear directional call + range coverage + closest midpoint (0.02 pp). Clean win.

Disagreement = Signal

Unlike W23 (all models wrong on Bearish), split views forced evidence-weighting. Two Bullish models were right.

Tracking Notes

New lineup (W24+) vs. prior (W22–23) — not directly comparable. Non-directional regimes need a documented scoring rule.

Thank You

Do you have any questions?
