

# Weekly Goal Updates

TEAM 1

# Timeline

## 8th JUNE

+ Present the previous week work for

Week 3

+ Assigned roles to each members for

new phase

## 9th June - 14 June 2026

+ create the automate collects  
data, runs the agents, queries  
four AI models, and commits a  
prediction to GitHub

## 15th June

+ Presentation about team works  
and what team have  
accomplished

# Sprint Goal

---

---

To create a **clear communication** and try to understand the new role functionality and work to develop Automate Scraping Data by Python. Splitting team into two team: Team Scrum Sprint Report and Development Backend

---

---

This sprint goal was established collaboratively between the Team Scrum Sprint Report and Development Backend to ensure that every deliverable is traceable, reviewable, and grounded in documented analytical reasoning not assumption. The emphasis on GitHub commits guarantees a fully auditable project trail for all stakeholders.

## Done:

- Final work should be finalized and agreed upon the whole team
- Github should be easier to work with
- Prototype for the automatic scraping system
- Slowly shifted from Waterfall to SCRUM
- Communication bridge
- Understand role functionality

# Scrum master

## Completed

- Collected updates from team members.
- Tracked sprint progress and blockers.
- Updated standup notes and retrospective.
- Try to update with the figma for the latest work

## Key Challenges

- Some tasks depended on other team members.
  - A few GitHub issues and merge conflicts caused delays.
  - Some updates were received later than expected.
- Team communication was sometimes unclear.

## Lessons Learned

- Notify more frequent
- Raise blockers sooner.
- Communicate more regularly.
- Review work earlier to avoid delays..

## Reflection

- Team members supported each other throughout the sprint.
  - Development progress improved during the week.
  - Good communication helped solve problems faster.
- The team completed important work for the project.

# R3 — Almanac Agent

Seasonal Patterns · 8-12 June 2026

ALMANAC BIAS

**Bearish**

Confidence: MEDIUM

## CYCLE CONTEXT

2026 = Midterm Year

Q2–Q3 = The Weak Spot (still active)

## JUNE VITAL STATS

**−2.1%**

S&P midterm year June avg

June ranks #9 of 12 in midterm year — dead last

## WEEK PATTERN

- No specific weekly pattern has been encoded yet for this date.
- Use the monthly seasonal bias as the base Almanac signal.
- Treat this as a low-confidence seasonal input until more data is added.

# Sprint 4: Multi-LLM Synthesis & Market Intelligence

WEEK 24

Our automated pipeline has captured a defining market moment — a high-stakes tug-of-war between powerful bullish technicals and deep historical seasonal headwinds. The system reached Level 3 automation, delivering 100% untampered machine consensus ahead of the critical June 18 FOMC binary event.

# Executive Summary: The Tug-of-War Market

## Regime Consensus

**Uncertain / Neutral** — Four LLMs in agreement that no clear directional edge exists heading into the Fed meeting.

## Core Conflict

**Bullish Technicals vs. Bearish Seasonality** — Short-term chart strength colliding with historically weak calendar conditions.

## The Catalyst

**June 18 FOMC Meeting** — A binary risk event capable of resolving the standoff decisively in either direction.

## Pipeline Status

**Level 3 Automation Achieved** — Manual prompt synthesis fully eliminated. Machine consensus delivered end-to-end.

 All data synthesized this week is 100% machine-generated — zero manual intervention, zero dummy data fallbacks.

# Engineering Triumph: The Resilient Pipeline

## LEVEL 3 AUTOMATION ARCHITECTURE

### Fail-Fast Pre-Flight

The pipeline aborts loudly on missing upstream data. No silent failures, no empty context windows passed downstream to models.

### Zero Hallucination Policy

All "dummy data" fallbacks have been permanently removed. Every data point fed to the LLMs is verified upstream JSON — no synthetic fillers.

### Robust Regex Parsing

Safely extracts floats and numeric signals from free-tier LLM conversational noise, ensuring clean structured output every run.

### Resilient Execution

If one model API times out or fails, the pipeline isolates that model, flags it explicitly as **FAILED**, and continues without disruption.

# Market Evidence: The Bull Case

TECHNICALS

## Risk-On Reversal Signal

The technical picture heading into Week 24 was unambiguous. Broad market breadth, declining fear, and small-cap leadership all pointed to a short-term bullish reversal. LLMs recognized these as high-conviction signals — but had to weigh them against the calendar.

- **SPX Support:** Holding the 21-day EMA at ~7,017
- **Small-Cap Leadership:** Russell 2000 (IWM) surged **+3.93%**
- **Fear Easing:** VIX declined **6.25%** to 20.17
- **Breadth:** 10 of 11 S&P sectors finished green

+3.93%

IWM Surge

20.17

VIX Level

Fear index declined 6.25%, easing volatility concerns

10/11

Green Sectors

Near-perfect S&P 500 sector breadth — broad participation

# Market Evidence: The Bear Case

## HISTORICAL ALMANAC

### Deep Historical Headwinds

The Almanac agent delivered a stark counterpoint. Despite the strong technical setup, the seasonal calendar is working directly against the bulls. This is not a minor headwind — it is the **single worst calendar period** for equity performance in a midterm election year.

➔ **Midterm Year June**

Ranks **12th of 12** — historically dead last for S&P 500 monthly performance.

➔ **The "Weak Spot"**

The Q2-to-Q3 transition is historically the most dangerous period for equity exposure.

➔ **Sector Shorts**

Financials and Materials face statistically significant seasonal downward pressure in this window.

⚠ June of a midterm election year is the **absolute worst-performing month** in the S&P 500 historical record — a direct contradiction to the current technical setup.

# Multi-LLM Consensus & Divergence

AI SYNTHESIS RESULTS — WEEK 24

Four models processed the same market evidence and returned a striking mix of caution and selective bullishness. The aggregate SPX projection range of **-1.5% to +1.2%** reflects genuine uncertainty — not model failure.

## Nemotron & Gemma

**Highly Cautious — Uncertain/Neutral.** Both models weighted the June 18 FOMC decision as an overriding binary risk, projecting flat to slightly negative SPX ranges. Defensive posture recommended.

## Laguna

**Selective Bullish with Macro Caveats.** Highlighted semiconductor sector outperformance as a genuine signal, but flagged geopolitical and macro disruption risks as potential override factors.

## GPT-OSS

**Bullish Outlier.** The only model strongly favoring the technical evidence. Projects IWM (Russell 2000) upside of **+2.0% to +5.5%**, citing small-cap momentum and risk-on breadth signals.

# Handover to Human Score: R7

THE FINAL MILE

## Machine Synthesis Complete

The pipeline has auto-generated `llm_comparison_w24.md` — a full divergence map across all four models. The machine's job is done. What remains is the judgment call that no model can make alone: **will the Fed meeting trigger a breakout or a breakdown?**

Machine  
Synthesis

R7 Human  
Score

Final Decision

## Human-in-the-Loop: R7

R7 receives the full divergence map and evaluates the one variable that defines the week's outcome — the June 18 FOMC binary risk. Human intuition, experience, and macro context are applied where machine models reach the edge of their confidence.

A live terminal demo of the Python extraction script is queued — showcasing the full pipeline executing in real-time from raw API calls to structured consensus output.

# Week 4 — Human Score Analysis

Score +2

NEUTRAL-BULLISH

| Dimension                  | AI Said                             | Score | Team Reasoning                                                                                    |
|----------------------------|-------------------------------------|-------|---------------------------------------------------------------------------------------------------|
| Macro / News Weight        | Binary-risk; yields ↓, oil ↓, DXY ↓ | +1    | Triple-loosening reversed W23 pressure. Iran deal adds tailwind. FOMC June 18 is key binary risk. |
| Technical Structure        | SPX above 21 EMA; IWM strongest     | 0     | Recovery underway but no clean breakout. SPX & NDX below ATH. IWM above both EMAs at 292.95.      |
| Almanac Seasonal Weight    | June = weakest midterm month        | -1    | S&P 500 ranks 12/12 in midterm-year June. Seasonal short signals still active. No reversal yet.   |
| AI Model Agreement Quality | 4 of 4: Uncertain/Neutral (Medium)  | +1    | All 4 models cited same 3 drivers: technical recovery, June seasonality, FOMC binary risk.        |
| Wild Card / Human Obs.     | Not flagged by any model            | +1    | Triple-loosening + chip rally (Intel +26%, KLA +32%) not captured by any of the 4 models.         |
| TOTAL                      |                                     | +2    | Macro +1 · Technical 0 · Almanac -1 · AI Agreement +1 · Wild Card +1                              |

# Week 4 Final Prediction

NEUTRAL-BULLISH

| Asset              | Direction | Range          | Confidence |
|--------------------|-----------|----------------|------------|
| S&P 500 (SPX)      | FLAT-UP ↑ | -0.5% to +1.2% | Medium     |
| Nasdaq 100 (NDX)   | FLAT-UP ↑ | -0.5% to +2.0% | Medium     |
| Russell 2000 (IWM) | UP ↑      | +0.5% to +3.0% | Medium     |
| Gold               | FLAT-DOWN | -1.5% to +0.5% | Low        |
| WTI Crude Oil      | FLAT      | -2% to +2%     | Low        |
| 10-Year Yield      | FLAT      | 4.35%–4.55%    | Medium     |
| VIX                | FLAT-DOWN | 17–22          | Medium     |
| Bitcoin            | UP ↑      | +2% to +8%     | Low-Med    |

## KEY EVIDENCE

- IWM +3.93%, NDX +2.17%, SPX +0.46% — SPX held 7,017 support
- Triple-loosening: oil −6.25%, yields ↓, DXY ↓
- 4 of 4 AI models: Uncertain/Neutral — same narrative, same drivers

## SECTORS

- ▲ Leading: Technology (XLK) — seasonal long active + chip rally
- ▼ Lagging: Communication (XLC) — only red sector, Meta & Google dragged

## WILD CARD

Triple-loosening (oil, yields, DXY all fell together) + chip sector surge not captured by any AI model

## INVALIDATION

Hawkish FOMC June 18 + SPX closes below 7,017 (21 EMA support)

# Indexes — Predicted vs. Actual

All three predicted Up · all finished Up

| Index              | Predicted | Actual (1W) | Close     | Hit? |
|--------------------|-----------|-------------|-----------|------|
| S&P 500 (SPX)      | Up        | Up 0.46%    | 7,431.46  | ✓    |
| Nasdaq 100 (NDX)   | Up        | Up 2.17%    | 29,635.95 | ✓    |
| Russell 2000 (IWM) | Up        | Up 3.93%    | 292.95    | ✓    |

## Week 04 Actuals — Indexes

All three bounced back · Russell led · recovery after Week 3

This is our Week 04 actuals for the three indexes we track every week. All three finished higher — a sharp rebound from Week 3. The Russell 2000 led — up 3.9%, close 293. Small caps bounced hardest. The Nasdaq was up 2.2%, close 29,636. Tech recovered unevenly — chips surged, mega-cap software lagged. The S&P closed at 7,431 — up 0.5%, holding above its 21-day average (~7,017).

| Index        | Ticker | Friday Close | Weekly Change |
|--------------|--------|--------------|---------------|
| S&P 500      | SPX    | 7,431.46     | Up 0.46%      |
| Nasdaq 100   | NDX    | 29,635.95    | Up 2.17%      |
| Russell 2000 | IWM    | 292.95       | Up 3.93%      |

## Week 04 Actuals — Macro

Fear eased · bitcoin rallied · oil sold off sharply

On the macro side — gold, oil, bonds, fear, and crypto. Fear eased — the VIX fell to 20.2, down 6.3% for the week. Traders calmed after Week 3 panic. Bitcoin bounced hard — up 5.2%, close around 63,670. Gold slipped again — down 2.9% to \$4,211. Oil sold off sharply — down 6.3% to \$84.84 a barrel. Opposite of the prior two weeks. Yields edged down to ~4.50%. Bonds up slightly.

| Asset         | Friday Close  | Weekly Change    |
|---------------|---------------|------------------|
| Gold          | \$4,211 / oz  | Down 2.90%       |
| Oil (WTI)     | \$84.84 / bbl | Down 6.25%       |
| 10-Year Yield | 4.50%         | Down (-0.04 pts) |
| TLT (Bonds)   | \$85.40       | Up 0.40%         |
| VIX           | 20.17         | Down 6.25%       |
| Bitcoin       | \$63,670      | Up 5.24%         |

## Week 04 — Sector Analysis

Broad recovery · materials & defensives lead · comms only red

| Rank | Sector           | Weekly Change |
|------|------------------|---------------|
| 1    | Materials        | Up 3.57%      |
| 2    | Consumer staples | Up 2.77%      |
| 3    | Financials       | Up 2.59%      |
| 4    | Real estate      | Up 1.82%      |
| 5    | Industrials      | Up 1.40%      |
| 6    | Technology       | Up 1.06%      |
| 7    | Consumer disc.   | Up 0.94%      |
| 8    | Health care      | Up 0.87%      |
| 9    | Utilities        | Up 0.40%      |
| 10   | Energy           | Up 0.07%      |
| 11   | Communication    | Down 1.50%    |

A broad recovery — 10 of 11 sectors finished green. Best: Materials, Consumer staples, Financials. Worst: Communication down 1.5% — only sector in the red. Week 3: tech dragged the market. Week 4: chip rally (Intel +26%, KLA +32%) lifted tech while mega-cap software still lagged.

**Best: Materials (+3.6%), Consumer staples (+2.8%), Financials (+2.6%)**

**Worst: Communication (-1.5%), Energy (+0.1%), Utilities (+0.4%)**

Week 3: all sectors struggled. Week 4: broad bounce across the board.

Chip rally — Intel, KLA, Applied Materials, Micron surged

Software lagged — Oracle (-14%), Microsoft (-6%), Apple (-5%)

### **What I checked this week**

- **Maintained the Week 4 calibration suite**
- **Prepared the W3 delta report structure**
- **Checked that prediction week and actuals week match before scoring**
- **Tracked SPX / NDX / IWM direction, confidence, and evidence quality**
- **Kept pending fields when the matching actuals were not fully confirmed**

**My role this week is R10 Calibration Lead. I focused on making sure the team does not score predictions using mismatched evidence. The main thing I prepared is the Week 4 calibration suite and W3 delta report structure. I checked that we only compare the locked prediction with the correct actuals week, because otherwise the calibration score would not be fair.**

## Main learning

- Direction alone is not enough for calibration
- We also need confidence level, prediction range, and matching actuals
- Clean locked predictions make the delta report easier to score
- R10 findings should support R7's Human Score decision

## Next step

- Update final W3 delta once actuals are confirmed
- Compare human call vs LLM consensus
- Record which model or agent was most accurate
- Feed the learning into next week's Human Score

The main learning is that calibration is not just about whether the market went up or down. We also need to check the confidence level, the predicted range, and whether the actuals are from the correct week. Once the actuals are confirmed, I will update the delta report and use it to show which part of the team process was accurate and which part needs improvement next sprint.

# GitHub Repository

- ¾ source fetching
- Fully automatic pipeline
