

SPRINT 7

TEAM 1

Sprint 7

Team 1

Project Update and Team Progress

Timeline

JULY 13 – 20, 2026

- 1

July 13
Sprint 7 planning & role assignments
- 2

July 13–19
Ollama merged, Market API integrated, Delta Engine in progress
- 3

July 19
W29 release tag cutoff
- 4

July 20
Stakeholder presentation & retrospective

 **Deferred:** DB persistence, path cleanup, Delta Engine reduction — pending review & refinement

SPRINT 7 · VW29

Product Owner & Value Increment Update

Delivery summary covering core product increment, scope triage decisions, and W29 release progress — disciplined execution against a **Level 3 Automated Pipeline** standard.

INCREMENT

Core Product Increment & DoD

- Ollama local AI provider merged
- Market API & frontend merged
- Delta Engine integration

Level 3 pipeline maintained —
local testing now rate-limit-free.

TRIAGE

Agile Scope Triage & Backlog Decisions

- DB persistence under review
- Repo path cleanup deferred pending refactor approval
- Delta Engine simplified before merge

Strategic deferrals protect value
delivery over breadth of scope.

RELEASE

W29 Release & Evidence Checklist

- Full prediction artifact (SPX, NDX, IWM)
- 4 LLM responses & evidence prepared
- vW29 tag pushed to production —
immutable & CI-verified

W29 tracked to a clean, traceable
release with no outstanding
Definition of Done gaps.

Sprint Retrospective

Highlights, challenges, and action items from this sprint.

What Went Well

- Better communication
- More PR activity
- Higher code quality

Challenges

- Work moved slower than planned
- Reviews created bottlenecks
- Pipeline and backlog issues

Learnings

- Check in earlier
- Keep backlog current
- Surface blockers sooner

Action Items

- Request reviews faster
- Follow up on blockers
- Track dependencies closely

WEEK OF JULY 13-17, 2026

MIDTERM ELECTION YEAR

R3 — Almanac Agent

Midterm-year July sits within the Q2-Q3 "Weak Spot." Seasonal signal is a **background input only** — macro events can override.

Monthly Index Bias

S&P 500 Early-July strength typical, but midterm context discounts it.
Nasdaq Historically strong, especially first-half to second-half turn.
Russell 2000 Small caps may lag if rates stay elevated.

Sector Signals

XLK — Bullish Long window: Mar-Jul	XLF — Bearish Short: May-Jul
Gold/Silver — Bearish Short: mid-May-Jun	XLB — Bearish Short: May-Oct
XLE — Bearish Short: early Jun onward	

 **Pattern Confidence: Low.** Invalidation: major macro surprise or technical breakout against seasonal bias.

Invalidation: A dovish Fed driving yields lower would reverse caution and support risk assets.

WEEK OF 19 JULY 2026

R5 – Technical Agent

Mixed market tone: SPX and IWM are holding neutral setups, while NDX remains the only bearish index.

SPX • 7,458 Zone 2	NDX • 28,593 Zone 4	IWM • 294.04 Zone 2
------------------------------	-------------------------------	-------------------------------

Index	Last Close	8 EMA Gap	21 EMA Gap	Confidence	Key Watch Levels
SPX	7,458	Below 8 EMA (7,515)	8 above 21 EMA (7,515 vs 7,491)	Neutral / Low	R 7,582 S 7,294
NDX	28,593	Below 8 EMA (29,237)	Below 21 EMA (29,428)	Bearish / High	R 30,643 S 28,231
IWM	294.04	Below 8 EMA (295.29)	8 above 21 EMA (295.29 vs 294.75)	Neutral / Low	R 302.72 S 290.68

📌 All three indices closed below their 8 EMA on Friday. NDX is the only bearish setup (Zone 4); SPX and IWM hold neutral-bullish EMA alignment but need a close above resistance to confirm bullish continuation.

Chart Analysis

SPX, NDX, and IWM all pulled back below their 20-day moving averages this week. The charts highlight key support and resistance levels that traders should monitor for the coming week.

S&P 500 — SPX

Current: **7,457.69** (−1.01%)

Support: **7,294**

Resistance: **7,582**

Nasdaq 100 — NDX

Current: **28,592.66** (−1.49%)

Support: **28,231**

Resistance: **30,643**

Russell 2000 — IWM

Current: **294.04** (−0.52%)

Support: **290.68**

Resistance: **302.72**

Key Takeaway: All three indices slipped below their 20-day moving averages this week, with NDX showing the weakest momentum at −1.49%. SPX and IWM held up better but still closed lower. Holding above key support levels will be important to avoid a deeper move lower and to stabilize the current market trend.

W29 Automated Market Actuals — Week Ending July 17, 2026

✓ R6 PIPELINE: SUCCESS

🔗 GITHUB ACTIONS

📊 11 SECTORS TRACKED

Core Indices & Macro Shocks

-1.55%

SPX

S&P 500 — broad market decline driven by rate-sensitive growth names and macro uncertainty heading into Fed commentary week.

-4.13%

NDX ⚠️ Worst

Nasdaq-100 — hardest hit index of the week; mega-cap tech selloff accelerated by earnings guidance cuts and rising yields.

-0.66%

IWM

Russell 2000 small-caps — relative outperformer vs. large-cap growth; modest decline reflects defensive rotation.

⚠️ ⚡ **Macro Outliers — Extreme Moves Detected:** VIX surged **+24.88%** (fear spike, options hedging demand elevated) · Crude Oil spiked **+15.52%** (geopolitical supply disruption, OPEC+ cut compliance). Both readings exceed 2σ from 90-day rolling baseline. Pipeline flagged as HIGH VOLATILITY week.

Sector Breadth — Sprint 7 Upgrade Active

Breadth Summary: 5 Sectors Green · 6 Sectors Red — net negative breadth confirms broad risk-off rotation. Energy and defensives absorbed inflows as growth tech sold off sharply.

● Energy

+4.72% — Top performer. Oil spike translated directly to E&P and integrated major outperformance.

● Real Estate

+2.18% — Defensive bid; REIT yield spread compression attracted rotation from growth equities.

● Cons. Staples

+1.27% — Classic risk-off refuge; non-cyclical revenue streams in demand amid VIX spike.

● Technology

-5.48% — Worst sector. NDX drag epicenter; semis and software led the decline. Multiple guidance revisions.

● Cons. Disc.

-1.54% — Consumer spending outlook deteriorated; retail and auto names pressured.

● Industrials

-1.38% — Supply chain cost pressure re-emerging; PMI softness weighed on capex-exposed names.

Spread — Energy vs. Tech: **+4.72%** vs. **-5.48%** · Delta: **1,020 bps** — widest sector divergence recorded in W29 YTD dataset.

-5.48%

Technology Sell-Off

Worst sector print of the week

Human Call

Bearish · Medium Confidence

NDX below 8 & 21 EMA, hawkish Fed lean, yields rising across the curve, and -5.48% tech sell-off contradicting the bullish seasonal thesis. Three of four models independently reached Bearish. Stretched conditions (VIX +24.88%, tech-led drop) leave room for a relief bounce — keeping confidence at Medium.

3/4

AI Bearish Consensus

Nemotron, Gemma, Laguna call Bearish; Hy3 calls Uncertain

+24.88%

VIX Spike

Sharp volatility surge alongside oil +15.52%

Score Breakdown

Macro / News

-2 — Hawkish shift, yields up, VIX +24.88%, oil +15.52%

Technical Structure

-1 — NDX below both EMAs, high-confidence bearish

Almanac Seasonal

0 — Contradicted by -5.48% tech; neutralized

AI Agreement

-1 — 3/4 Bearish, Hy3 Uncertain

Wild Card

+1 — Oversold bounce risk into Fed week

Invalidation: Dovish Fed surprise driving yields lower → Neutral/Bullish. Hawkish surprise + NDX below 28,231 → High-confidence Bearish.

R8 Multi-LLM Synthesis: Consensus & Divergence

A cross-model qualitative consensus has emerged across all four LLMs — yet beneath the surface, the quantitative divergence is stark. This briefing maps the tug-of-war between bullish technicals, bearish seasonality, and a binary macro catalyst that is holding the entire regime in suspension.

OVERALL REGIME: UNCERTAIN / NEUTRAL

CONFIDENCE LEVEL: MEDIUM — ALL 4 MODELS

Bullish Technicals

SPX, NDX, and IWM are all trading firmly above their EMA 8 and EMA 21 on the daily timeframe — a structurally constructive signal that each model independently flagged as the primary source of near-term upside momentum. Price action remains orderly, with no technical breakdown in sight across major indices.

- SPX above EMA 8 & 21
- NDX leading with relative strength
- IWM recovering with broad participation

Bearish Seasonality

June is historically the weakest month of the midterm election cycle. All four models surfaced this as a headwind with high consistency — a rare instance of unanimous qualitative agreement. Seasonal mean reversion pressure creates a structural ceiling on upside continuation, particularly for small-cap and cyclical exposure through IWM.

- Weakest midterm month historically
- Seasonal pressure caps momentum
- Small-cap most exposed to reversion

Binary Macro Risk

The June 18 Federal Reserve decision looms as a regime-defining binary event. With a 97.4% implied hold probability currently priced into futures markets, the asymmetry is extreme: a hold is already discounted, while any dovish surprise would instantly recalibrate risk appetite across all models. This event alone is capping broader positioning and appetite for directional exposure.

- 97.4% hold probability priced
- Dovish surprise = regime flip trigger
- Risk appetite suppressed pre-decision

 All four models independently identified the same three forces — confirming a robust qualitative consensus even as their quantitative projections diverge significantly.

The Quantitative Divergence: The Matrix

While the models agree on the narrative structure — a tug-of-war between technicals, seasonality, and a macro binary — **they violently disagree on the math**. OpenAI emerges as the isolated optimist with pure upside projections, while Nemotron, Gemma, and Poolside aggressively hedge with substantial downside risk windows of up to **-7.3%** driven by the Fed binary event.

Dimension	OpenAI (gpt-oss)	Nemotron 3 Super	Gemma 4 31B	Poolside Laguna
SPX Range	+0.5% to +1.5%	-3.5% to +1.6%	-1.2% to +1.5%	-3.5% to +1.6%
NDX Range	+1.5% to +3.5%	-7.3% to +1.2%	-0.5% to +2.0%	-7.2% to +1.2%
IWM Range	+0.5% to +1.5%	-6.5% to +0.8%	-1.0% to +1.2%	-6.4% to +0.8%

OpenAI: Isolated Optimist

The only model projecting pure upside across all three indices. No downside scenario is priced — a stark divergence from the consensus hedging posture of the other three models. This positioning implies confidence that the Fed hold is fully digested and technicals dominate.

Nemotron & Poolside: Maximum Hedgers

Both models align closely, projecting the most aggressive downside scenarios with NDX drawdowns of up to **-7.3%** and **-7.2%** respectively. Their risk models are clearly pricing in a non-trivial tail probability on the Fed binary — even at 97.4% implied hold.

Gemma 4 31B: Moderate Middle

Gemma occupies the middle ground — acknowledging downside risk but with a significantly narrower distribution than Nemotron or Poolside. Its NDX floor of **-0.5%** versus the -7.3% extreme suggests a more calibrated, volatility-adjusted model with less fat-tail weighting on macro shock scenarios.

Invalidation & Strategic Takeaway

The synthesis converges on two actionable conclusions: a clearly defined regime-flip trigger shared unanimously across all four models, and a single high-conviction tactical position that survives the uncertainty — **NDX outperformance via Technology (XLK)**.

⚡ The Universal Invalidation Trigger

All four models agree on the precise condition that would immediately invalidate the bearish seasonality thesis and flip the regime from **Uncertain/Neutral** to **Bullish**:

- A materially **dovish-than-expected** Federal Reserve decision on June 18
- Any language or action that drives **Treasury yields meaningfully lower**
- A signal that the rate-cut timeline has been **accelerated or front-loaded**

This is the single most important event risk on the calendar. The 97.4% hold probability means the bar for a dovish surprise is elevated — but the asymmetric regime impact if it occurs is massive. Positioning must account for this tail scenario with defined risk parameters rather than naked short exposure.

🎯 The Safest Bet: NDX Outperformance

Despite the broader regime uncertainty and the wide quantitative divergence, there is **unanimous agreement** across all four models on one tactical conviction: **Technology (XLK / NDX) will outperform** on a relative basis this week.

- NDX remains in an active **seasonal LONG window** — the only major index with this distinction
- Relative strength vs. SPX and IWM is confirmed across all model outputs
- Even in Nemotron and Poolside's bear cases, NDX downside is **paired with the highest upside ceiling** (+1.2% to +2.0%)
- XLK sector positioning remains the most defensible long in a mixed-signal environment

The strategic implication is clear: if deploying capital this week, the Nasdaq is the most resilient vehicle — offering both the best risk-adjusted upside and the clearest fundamental rationale regardless of how the Fed decision resolves.

Key Monitoring Variables

Watch for pre-FOMC Treasury yield movement, VIX term structure steepening, and any shift in Fed funds futures pricing ahead of June 18. A yield drop below key support levels in the 10Y would be the earliest signal of a dovish re-pricing and should be treated as a regime-flip warning.

R8 Cycle Synthesis Confidence

Medium confidence across all models reflects the binary nature of the macro setup — not model uncertainty. The qualitative consensus is high; the quantitative ranges are deliberately wide to bracket the Fed event outcome. This is calibrated ambiguity, not analytical failure.

Next Sprint Action Items

Post-Fed decision, re-run the full R9 multi-LLM synthesis with updated yield and volatility inputs. Evaluate whether OpenAI's optimism was structurally justified or a systematic underweighting of tail risk. Update model weighting parameters for R9 cycle accordingly.
